NAME
msense – get mode sense data

SYNOPSIS
msense -a b.t.l [ -p pagecode ]

DESCRIPTION
The msense program will send a MODE SENSE command to the named device.
The required -a argument must be used to select a specific ordinal SCSI address (see libscsi(8)).
The optional -p pagecode argument may be used to select a specific mode page, else all pages are fetched (code 0x3f). This argument must be specified in hexadecimal notation.

BUGS
The output is a not human readable. It is intended as input to pmode(8).
